Tally Direct Integration using .NET (XML over HTTP)

Overview

This document explains how to integrate a .NET application with Tally ERP 9 to push Ledgers, Vouchers, and Inventory data directly using XML over HTTP. This approach is best suited for one-time data push scenarios.

How the Integration Works

1. Data is generated in the .NET application

2. XML is built in Tally compatible format

3. XML is sent via HTTP POST to Tally (localhost)

4. Tally processes the request and creates masters/vouchers

Important: Tally application and the company must be open.

Tally Configuration Steps

Step 1: Enable XML over HTTP

Gateway of Tally → F12 (Configuration) → Advanced Configuration

Enable XML over HTTP = YES

HTTP Port = 9000

Tally acting as = Server

Step 2: Keep Company Open

Open Tally ERP 9

Open the required company

Select correct financial year

Do not close Tally during integration

Step 3: Enable Accounting Features

Gateway of Tally → F11 → Accounting Features

Maintain Bill-wise Details = YES

Allow Zero Valued Entries = YES

Step 4: Enable Inventory Features

Gateway of Tally → F11 → Inventory Features

Maintain Inventory = YES

Integrate Accounts with Inventory = YES

Step 5: Verify Voucher Types

Ensure Sales, Purchase, Journal, and Stock Journal voucher types exist.

Step 6: Verify Inventory Masters

Ensure Units of Measure, Stock Groups, and Stock Items are created.

Step 7: GST Configuration (If Applicable)

Gateway of Tally → F11 → Statutory & Taxation

Enable GST and configure GSTIN and State.

Step 8: Connectivity Test

Open browser and check http://localhost:9000

Pros

- No manual import required

- Faster one-time data migration

- Official and safe integration

- Better error handling

- Human approval supported

Cons

- Tally must be running

- Works only on Tally installed machine

- Not suitable for unattended automation

Best Practices

- Push masters first, then vouchers

- Test with small data before full push

- Maintain logs for success and failure

Summary

This integration is ideal for controlled, one-time data migration with human supervision.
