It is mandatory to enable ABHA with the following requirements:

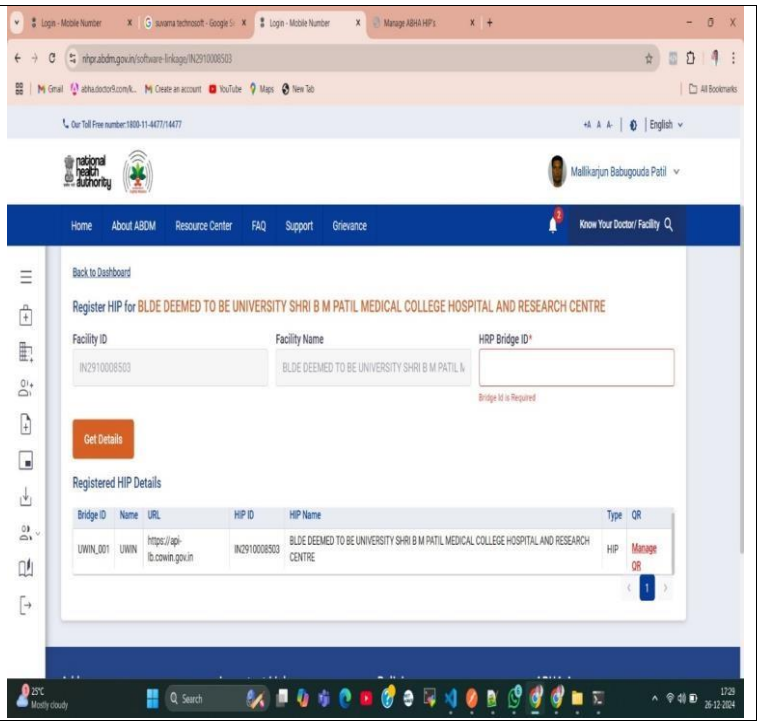

1) **HIP ID**
2) **Public IP**
3) **SMS vendor URL, OTP SMS template, and Template ID**
4) **From our side, we will provide the Bridge ID**

1. We require the HIP ID from the Hospital

1.1) If the hospital does not have a HIP ID, it must be generated on the NHPR portal. Once the HIP ID is generated, it should be integrated with our software.

1.2) After generating the HIP ID, the mobile number associated with it is required. Obtain the OTP sent to the linked mobile number, log in to the NHPR portal, and integrate it with our software.

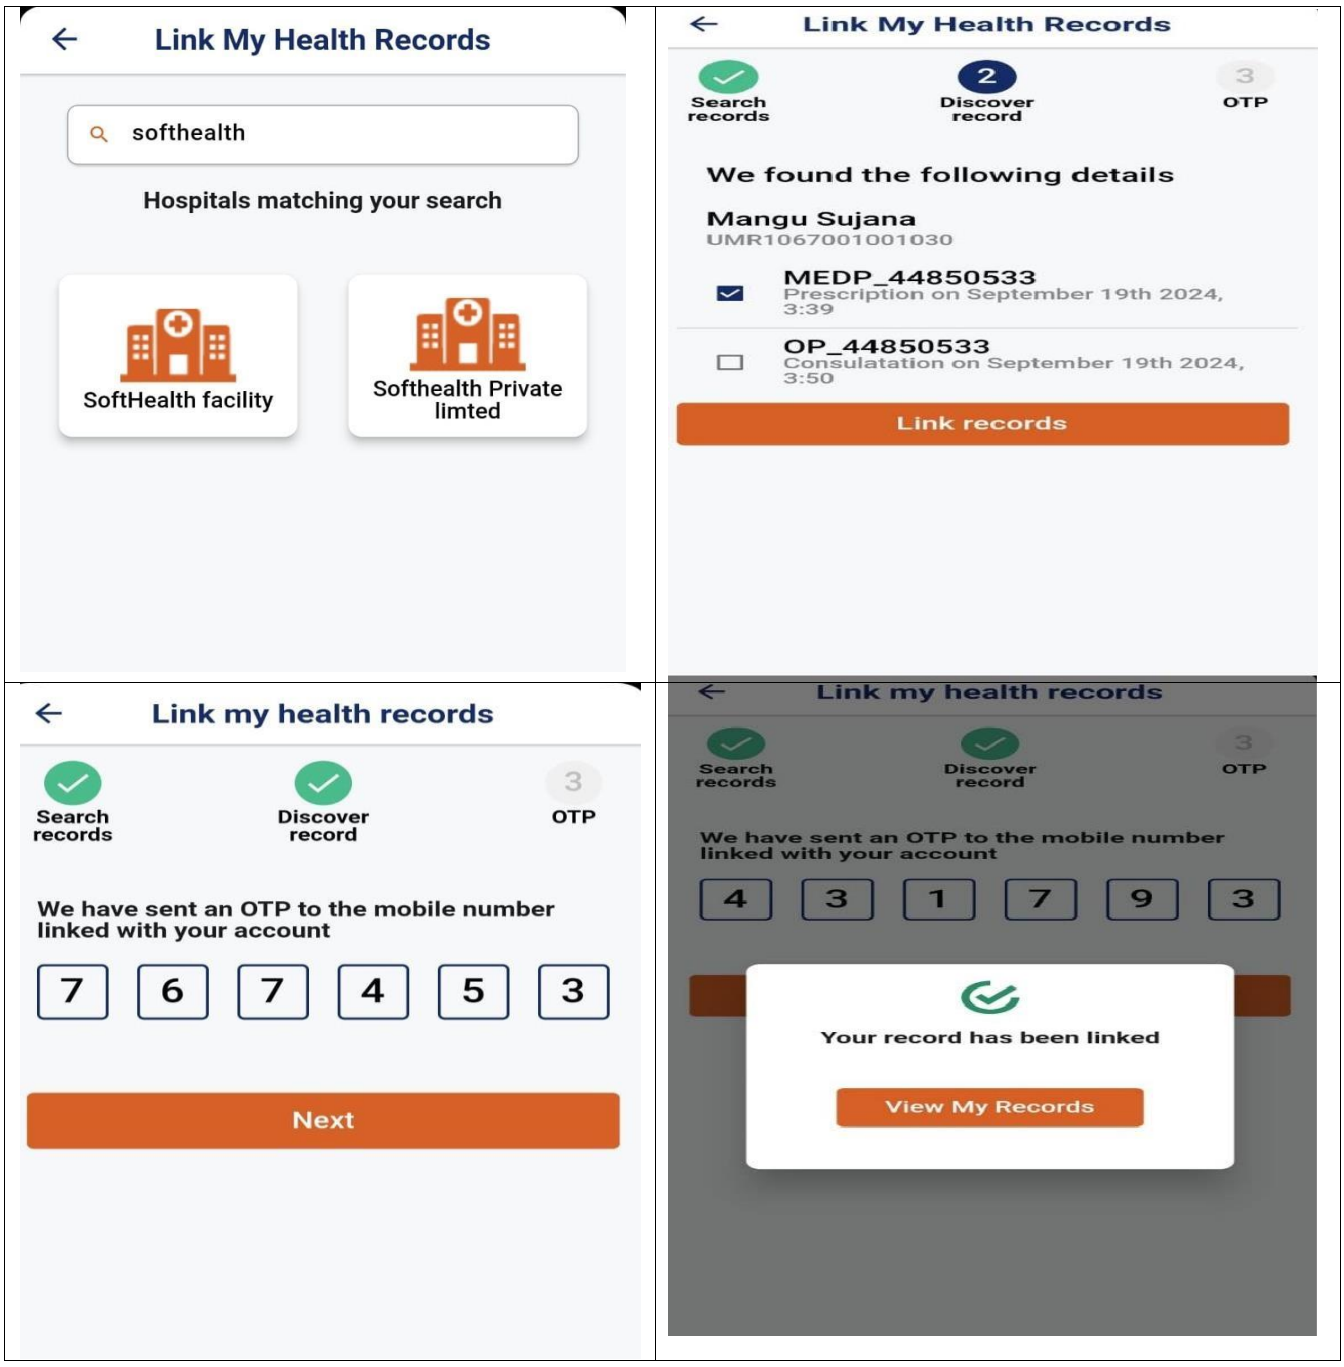

2. We require the Public IP from the Client

2.1) We can access patient data from multiple hospitals and share it with multiple hospitals, with patient authentication.

3. **We require the SMS Vendor Details**

3.1) We need the SMS vendor URL, OTP SMS template, and Template ID from the client to enable OTP functionality for linking care contexts to the hospital.

3.2) Refer to the images below for guidance on linking the care context to the patient. The process involves generating an OTP from the hospital's vendor and using it to link the care context.

4. From our side, we will provide the Bridge ID during HIP ID creation. This Bridge ID should be used to link the software. ABHA will work only after the software is linked using this Bridge ID; otherwise, ABHA will not function.
